poles along an arc by 90 degrees or less, each of said first and second pairs of reluctance gaps being formed in a different one of said first and second pole tip portions, the reluctance gaps in each of said pairs being spaced apart along an arc of less than forty degrees; and,

a cylindrical armature rotatably mounted in said second inner open space, said armature having a selected diameter, the ratio of said diameter to said width of each of said stator laminations in said outer portion being in the range of 1:2.36 to 1:4.4, said diameter of said armature permitting said armature to be utilized in a C-frame shaded multiple-pole subfractional horsepower induction motor for a water pump for an evaporative cooler.

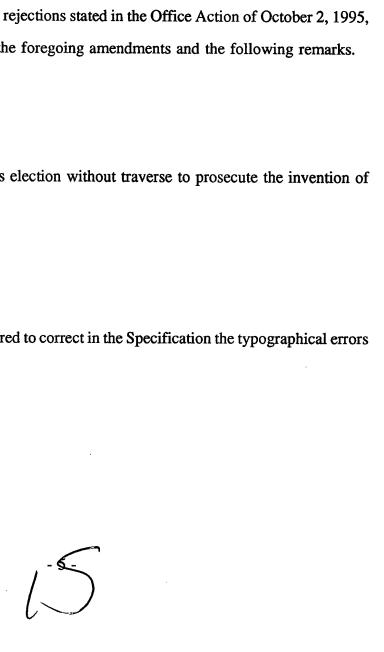

7. The motor of Claim 3 wherein said diameter of said armature is in the range of 0.75 to 1.4 inches.

8. The pump of Claim wherein said diameter of said armature in said concentric motor is in the range of 0.75 to 1.4 inches.

9. The motor of Claim 1 wherein the distance along an arc between the reluctance gaps comprising each of said pair of reluctance gaps is in the range of twenty to twenty-two degrees.

The pump of Claim 8 wherein the distance along an arc between the reluctance gaps comprising each of said pair of reluctance gaps is in the range of twenty to twenty-two degrees.

The motor of Claim & wherein each of the reluctance gaps opens outwardly from said second inner open space. -12. The pump of Claim & wherein each of the reluctance gaps opens outwardly from said second inner open space .--REQUEST FOR RECONSIDERATION The Examiner's thoughtful attention to this application is sincerely appreciated. Reconsideration of the rejections stated in the Office Action of October 2, 1995, is respectfully requested in view of the foregoing amendments and the following remarks. Restriction Applicant confirms his election without traverse to prosecute the invention of Group II, Claims 3 to 5. **Specification** Applicant has endeavored to correct in the Specification the typographical errors identified by the Examiner.

Section 112

Applicant has corrected in Claim 3 the antecedent basis discrepancy identified by the Examiner.

The Problem

For many years, two types of subfractional horsepower induction motors--a C-frame (offset) motor and a concentric motor--have been utilized to provide motive power for evaporative cooler water pumps. One particular drawback of this system is that each type of motor requires a different size rotor.

The Invention

In accordance with the invention, Applicant provides a concentric shaded multiple-pole subfractional horsepower induction motor for a water pump in an evaporative cooler. In operation, Applicant's novel motor functions to run more efficiently and utilize a rotor which can also be utilized in a C-frame motor. In order to achieve these functions, it was necessary to include novel structural features in the claimed combination:

1. The ratio of the diameter of the armature to the width of the stator laminations is in the range of 1:2.36 to 1:4.4. In other words, Applicant reduced the diameter of the armature from the diameter typically found in conventional concentric motors. The armature diameter was reduced because the armature diameter in conventional C-frame motors is less than the armature diameter in conventional concentric motors.

28

In order to reduce the armature diameter in a conventional C-frame motor, Applicant had to provide a pair of reluctance gaps at each of the pole tips portions of the motor.

3. Further, the reluctance gap pairs each had to be less than ninety degrees from its associated shaded pole.

The foregoing is why the Specification notes:

"Another object of the invention is to provide an improved concentric subfractional-horsepower induction motor which utilizes an armature or rotor which can be interchangeably utilized on a C-frame stator in a subfractional-horsepower induction motor." Page 2, lines 3-7. See also Specification, p. 8, lines 26 to 30.

The reluctance gaps, armature diameter-to-laminate width ratios, etc. specified in the Claims are critical because they are necessary to produce a concentric motor which functions efficiently and which permits the armature to be interchanged with a C-frame motor.

Since none of the references of record appear to address the problem solved by Applicant, none of the references appear fairly to suggest the concentric motor of the invention. As noted by the Examiner, the Lautner reference does not disclose reluctance gaps nor the intended ratio of the armature diameter to the width of the stator laminations, the Lee reference fails to disclose the intended ratio of the armature diameter to the width of the stator laminations, etc. Further, structural differences between the Lautner motor, Lee generator, and

the motors described in other of the references of record mitigate against the likelihood that 1 2 Applicant's novel combination is suggested. 3 Accordingly, Applicant respectfully submits that the invention as described in 4 the amended Claims is not rendered obvious under 35 U.S.C. Section 112 by the references 5 6 of record, whether taken singly or in combination. 7 8 The Claims 9 10 The foregoing amendment cancels Claims 1, 2, 4, 5, amends Claim 3, and 11 inserts new Claims 6 to 12. The new Claims more clearly recite the features of the invention 12 discussed above. 13 If the Examiner finds merit in the foregoing amendments and remarks, it is 14 believed the application is condition for allowance, and such action is earnestly solicited. 15 16 17 Respectfully submitted, 18 19 Tod R. Nissle, Reg. No. 29,241 20 TOD R. MISSLE, P.C. 7150 East Camelback Road 21 Suite 245 Scottsdale, Arizona 85251 22 (602) 970-8700 23 Attorney for Applicant 24 Attorney's Docket No. 555-P-6 25 26 27
